LiDAR Maze 10/19

Controls + mechanical

What we did last week

- Power: looked in to buck converters and level shifters
- Mechanical: designed motor mounts
- Controls: wired motors to arduino

New: Put the stuff you're working on in the white cardboard box. I will not touch anything in there and bring it to every meeting.

What we are doing today

- Power: ltspice setup OR down to lab and learn about bench supplies and oscilloscopes ? (might get kicked out lol)

- Mechanical: design test chassis for just the motors, arduino and wheels based on the position that controls team gives (and send it to print)

- controls: do math (python) to determine best angle + position to mount wheels

meeting wrap up

- Raise of hands: who would be interested in a soldering workshop?
- Any other questions? Ideas on how we can better support you/structure the meetings? leads will stick around.

attendance

Miss one: warning

Miss two: speak to lead

Miss three: kicked from project

Please communicate your absences! We are flexible

Code: wind
